
Tabby Context

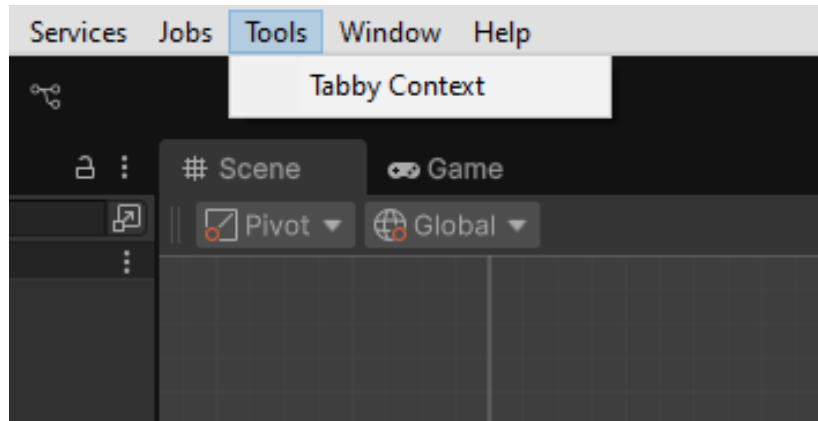

TABBY CONTEXT - OVERVIEW

Tabby Context is a tool for enhancing unity's built-in context menus. The following is an overview of available features:

- Hiding of unwanted items
- Reordering of items
- Creation of custom items and submenus for better organization
- Moving items between submenus
- Customizable icons for menu items
- Use the scroll wheel to get through large menus
- Automatically adapts to dark and light mode
- Easy to swap menu profiles for different workflows

TABBY CONTEXT MENU

To start customizing your menus, go to the Tabby Context settings page, located under Tools/TabbyContext

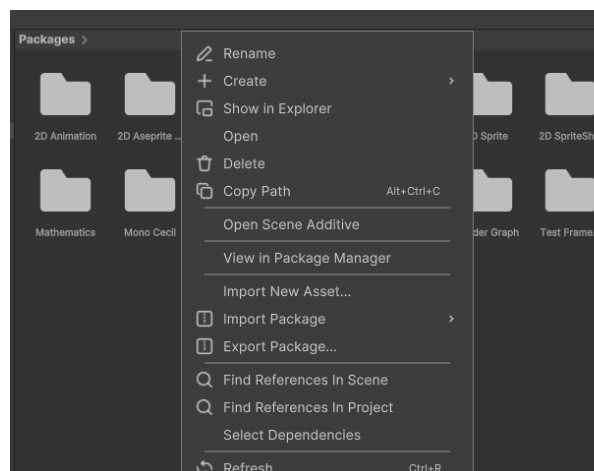

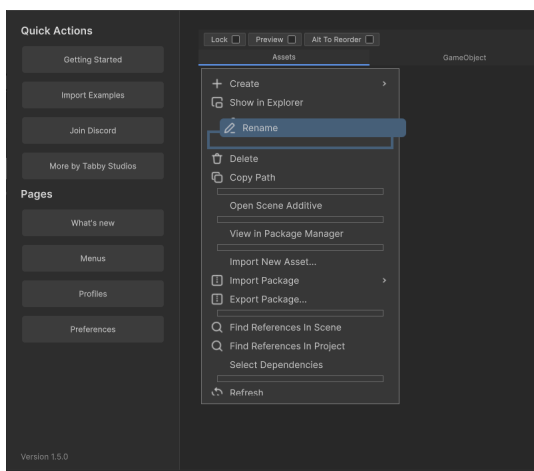

MENUS

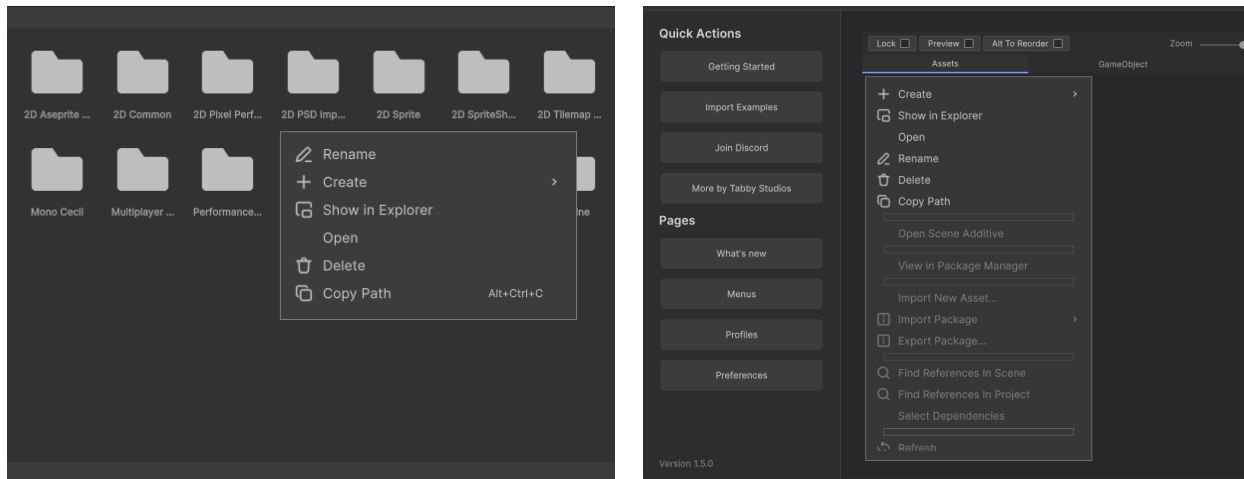

In the menus tab you will see a copy of the current state of the context menus for either the project browser or the hierarchy windows. To begin customizing, you can click and drag any item to reorder it, or **control click** to hide unwanted items

Important: Menus other than the project browser, hierarchy and scene view can't be customized, and are not enabled by default. To enable them enable the “Anonymous menus” option in the preferences tab.

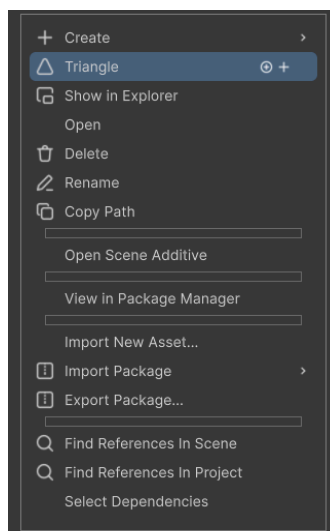

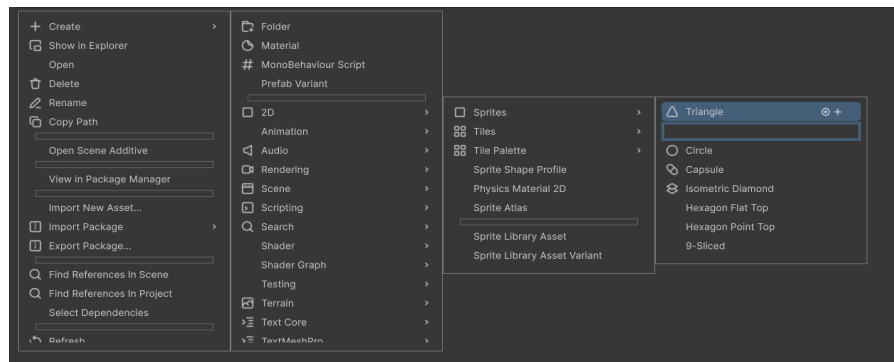

An example of an item being reordered to appear in the first position of the project browser menu:

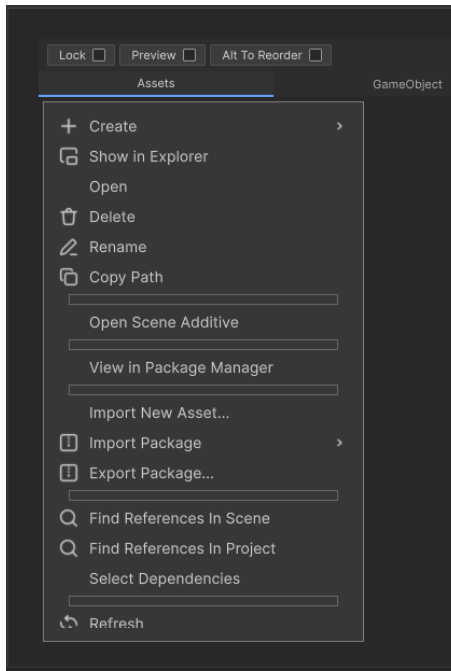

And hiding Items via control click:

Items can also be easily moved between submenus by clicking and dragging

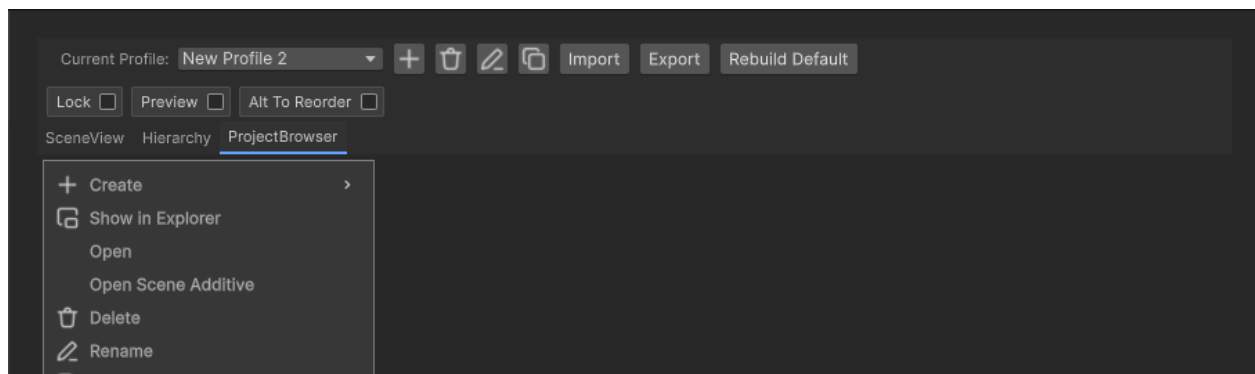

In the menus tab you also have access to the following options

1. Lock the current view so that new menus are not opened or closed when hovering over items. Useful for rearranging items or moving them between submenus. Can also be activated by pressing L.
2. Display menu as preview, so that menus appear the same as in the editor. In this mode hidden items are not shown at all and some other features are not available. Can also activate by pressing P.
3. While on, you must hold the alt key to reorder items. Useful if you don't reorder them by accident.

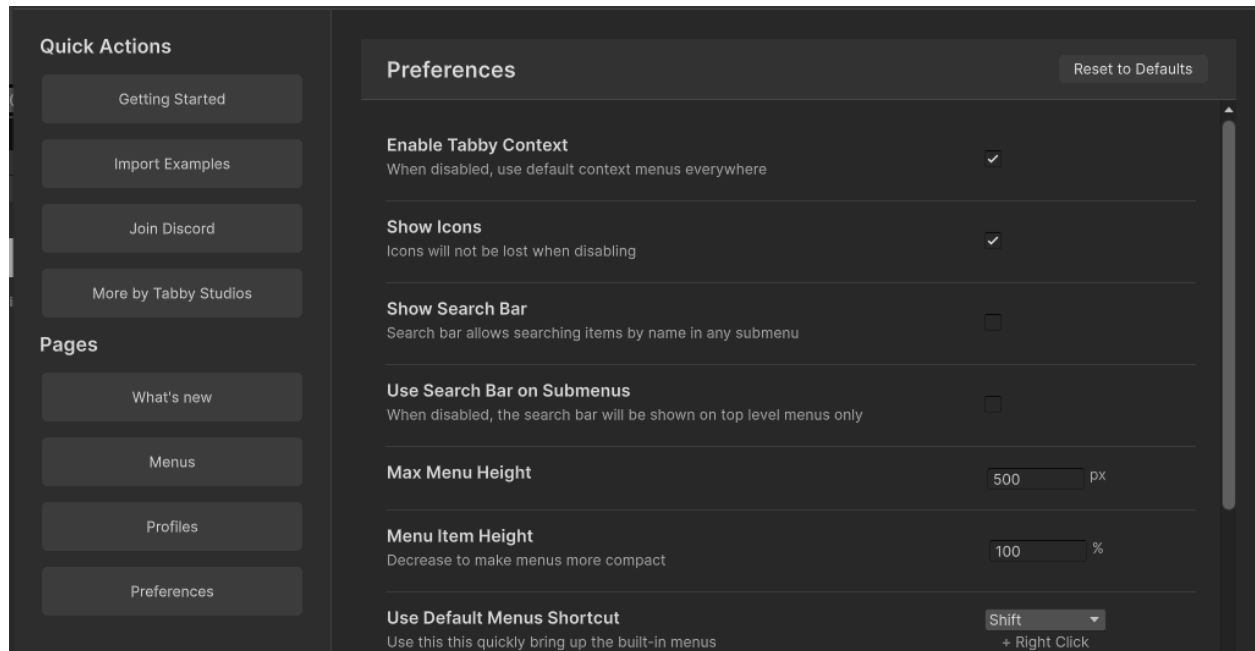

PROFILES

You also have the option to create menu profiles. Each profile will hold all customizations made on menus. This will allow you to have different menus for different workflows or experiment until you find a layout you like.

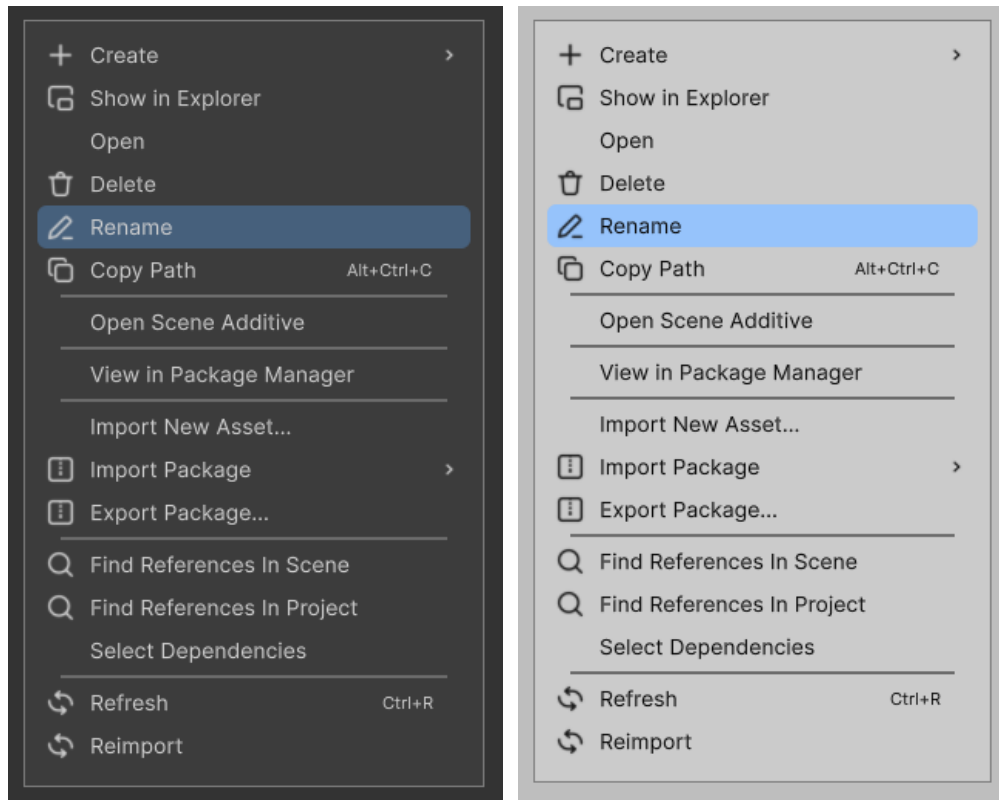

Profiles are specific to each project, but can be exported as a json file and imported in other projects or kept under version control if you like. Be careful when deleting a profile as they cannot be restored.

PREFERENCES

The preferences tab displays extra customization options. Preferences are shared between projects and can be exported and imported as a json file. More information about each option is available as a tooltip in the settings page. You can also find experimental settings at the bottom of the page to enable experimental settings that may be incomplete or unstable.

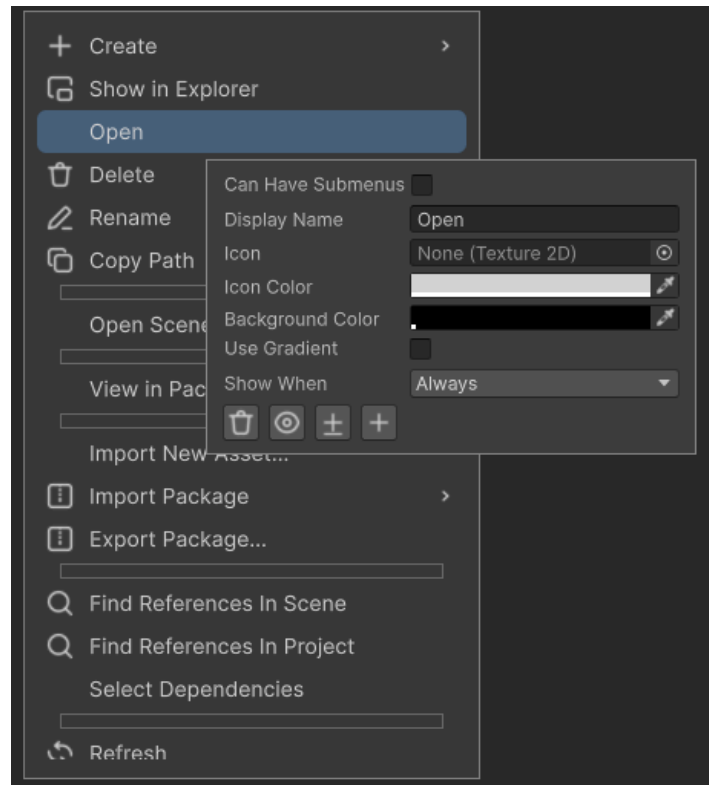

LIGHT AND DARK MODE

Custom menus will automatically adapt to your editor theme. The menus are built using UI Toolkit and are easily customizable through the provided uxml files.

ICON CUSTOMIZATION

You can right click on an item while inside the settings page to bring up extra options for each item, where you may choose an icon to use for each item. Any Texture2D asset may be used as an icon, but currently they must be placed inside Res/Icons, in the same folder as the bundled icons. Icons are not shared between profiles.

EXTRA ICONS

Under TabbyStudios/TabbyCommon/Res you can find a package containing some extra icons to use in your menus if you desire, they are kept separate to prevent adding unnecessary assets to your project
